

Modernize with Windows Server 2022

Can you afford to not upgrade?

Did you know that Windows Server 2008/R2 reached End of Support in January 2020, whereby Microsoft no longer provides security fixes? Yet despite this, there are many thousands of WS2008 / WS2008 R2 servers in use today – upgrade to the latest version of Windows Server now to protect your data and safeguard your business.

What are the risks of not upgrading?

Servers still running Windows Server 2008/R2 after End of Support run the risk of being completely unsupported and unprotected.

Data will be at risk. No more security updates means new vulnerabilities will not be fixed.

Data compliance could be at risk. Typically, data compliancy requires businesses to take appropriate steps to prevent data breaches. This includes taking a modern approach to security.

Which versions of Windows Server can you upgrade to?

Windows Server 2022 is available now. It will continue to receive product support (including security updates) until at least 2031.

With Windows Server 2022 you gain advanced multi-layer security, hybrid capabilities with Azure and a flexible platform to modernize applications with containers.

Can you upgrade on existing hardware?

Although, the latest Windows Server has different hardware requirements to Windows Server 2008/R2 and other versions, most legacy servers are not certified for new Windows Server versions.

To take full advantage of modern security, cloud, performance and efficiency features, running Windows Server 2022 on the latest servers is recommended.

Lenovo

What does it take to upgrade?

Lenovo makes it easy to upgrade with an industry-leading server line-up optimized for the latest version of Windows Server.

We can guide you on a smooth migration path with professional Lenovo services, even if your existing servers are from another vendor.

Microsoft and Lenovo's strong partnership means we can provide a fully integrated solution whatever the size of your business.

Lenovo is #1 for reliability in the ITIC global x86 server survey – and has been for 7 consecutive years.
